

FLOORS THAT ARE UNEVEN OR CABINETS SEPARATING FROM THE WALL

When did the settlement or cracking occur?

- Is the problem getting worse?
- Did you stop the cause, or is the cause ongoing and getting worse overtime?
- How long are you willing to wait until the problem gets bad enough to finally call a professional?

Look at the counters in your kitchen and bathrooms. Many remodelers don't consider the additional support required when installing new kitchens and baths. Counters that have started to pull away from the walls can be a sign of foundation settlement. You may also see cracks starting to form in your counter-tops. This can be a sign of not having proper support, especially if the counter begins to slope, but it can mean serious foundation issues. You may need to call in a foundation repair expert to do an inspection.

With that in mind, it's time to consult with a foundation repair professional that understands not only what to look for, in determining the cause or multiple causes, but also can offer you enough information so you can make the best decision for your needs and requirements. You see, there are many options and methods to either repair a foundation back to its original condition or stop the settlement to reduce potential future damage. Which one is right for your foundation problem? We don't know, not yet, but in many cases, what was perceived as a foundation issue, turned out to be something completely different. The key is, hiring the right professional that can work within your budget, to provide the best repair option for every dollar you spend. In closing, we would like you to consider [FoundationRepairSoCal](https://www.FoundationRepairSoCal.com) as your trusted advisor, to provide you with the best repair solution for your foundation problems.
